

EuroSkyPark strengthens offshore division

A lot is happening in the offshore industry: the energy transition is in full swing. This is leading to the construction of new platforms - new wind farms are constantly being built in the North Sea, throughout Europe and more recently in the USA. The offshore sector is correspondingly important for EuroSkyPark. The company provides blackout-proof satellite connection solutions to ensure stable operation even in harsh marine environments. The company is now increasing its proximity to key customers by opening a new branch at the Binnenalster in Hamburg.

Growing project requirements and the numerous future projects announced make this step essential for EuroSkyPark. The new office in Hamburg is an important representative office for the company. "We have our finger on the pulse of renewable energy and the offshore industry here," explains Head of Office Julius Schaad. Geographically, both the North Sea and the Baltic Sea around Germany, Belgium, the Netherlands, Great Britain, Denmark, Sweden and Poland can be covered very well from the Hanseatic

city. Many major customers are also present here in the north - Hamburg is an important hub and EuroSkyPark aims to offer a direct local point of contact.

The new office will officially open in March 2024. With its address on Jungfernstieg right next to the historic Hapag-Lloyd Rederei building, a very central location was chosen. Initially, three employees will be responsible for sales, technology, project

management and coordination. “From here, we can significantly reduce response times and establish and intensify contact with our customers,” says Schaad, explaining the reasons for this and the benefits for customers.

“For me personally, it is an exciting challenge to advance offshore projects with interesting customers.” EuroSkyPark’s satellite systems enable the control,

measurement and regulation of critical infrastructures through secure data transmission – whether designed as redundancy or as primary path. EuroSkyPark solutions offer a high level of security and are sustainable – also due to their long service life. The technology has already been tried and tested in many offshore projects and can become the standard in the offshore sector thanks to its high transmission reliability and performance.

About EuroSkyPark (ESP)

For over 20 years, EuroSkyPark GmbH has been providing its clients with secure and high-speed connections in the energy production, utilities, industrial, and security sectors. The company is a market leader in highly available data transmission for measurement, control, and regulation, operating extensive SCADA networks via satel-

lite. Leveraging this experience and proprietary technology, EuroSkyPark has established itself as an “enabler of the energy transition,” currently connecting eleven offshore wind parks in the North Sea, totaling seven gigawatts of power. The company is headquartered in Saarbrücken and has subsidiaries throughout Europe.
